19. Document Sign-Off.....	20

1. Document Control

Date	Version	Author & Business Unit Info	Reviewed By & Business Unit Info	Approved By & Business Unit Info	Change History
04 October 2026	1.1	iorta TechNXT			Template; one copy per release or patch. 1.1: sections for scheduled jobs, integration connectors, environment variables and keys, and regulatory settings to confirm

2. Acronyms

Acronym / Symbol	Definition / Meaning
OOTB	Out of the box
CAB	Change advisory board
CR	Change request
UAT	User acceptance test
API	Application programming interface
PHT	Philippine time (UTC+8)
P1, P2	Incident priorities 1 and 2

3. How to use this template

iorta TechNXT issues release notes with every patch, minor and major release, as required by the upgrade and versioning policy of the Release Notes and Product Roadmap and by the release management chapter of the Production Support Approach and Standards. The notes go to the broker's System Administrator and IT head with the request for change, at least 5 business days before deployment, and are attached to the CAB record.

- Copy the template, set the version number in the title, and replace every text in [square brackets].
- Use the system's own names for menus, screens, settings and statuses, exactly as on screen, for example Master > Configuration > Billing, Collections & Credit.
- Describe the effect on the user, not the code. Each item says what changes, for whom, and whether anyone must act.
- Delete the sections that have no content and this chapter before issue.

Release type	Content	Notice
Patch (1.0.z)	Defect fixes and security fixes; no change to how users work	5 business days; emergency release for a P1 or a security issue
Minor (1.y.0)	New functions, new reports, regulatory form updates, component upgrades; data and settings kept	5 business days
Major (x.0.0)	Changes that need a migration project, retraining or a change of hosting components	Announced at least 6 months ahead

4. Release identification

Item	Value
Product	iNXT BrokerVerse OOTB
Release	[x.y.z], [Patch / Minor / Major]
Repository tag and commit	[vx.y.z], commit [short hash]; GET /api/version shows it after deployment
Previous release in production	[x.y.z]
Planned deployment	[date], [time] PHT, in the maintenance window
Expected downtime	[none / minutes]
Change request (CAB)	[RFC number], approved on [date]
Prepared by	[name], iorta TechNXT

5. Summary

[Two to four sentences for managers: why this release, what users will notice, and whether any action is needed before or after deployment.]

6. New and changed functions

Area	Change	Who is affected	Action needed
[for example Accounting]	[what the user can now do, with the menu path]	[roles]	[none / train / switch on setting ...]

7. Fixed defects

Ticket or defect	Problem	Fix	Severity
[BV-DEF-nnn / ticket no.]	[what users saw]	[what now happens]	[P1 to P4]

8. Security fixes

Item	Component	Severity	Note
[advisory reference]	[package or component]	[critical / high / moderate]	[effect; no user action / action]

Security patches follow the agreed timelines: critical within 14 days and high within 30 days of a fix being available.

9. Regulatory and configuration changes

Item	Change	Setting or master	Delivered value	Broker to confirm
[for example premium tax rule, BIR form layout, DAT file layout version, AMLC transaction codes, IC complaint deadlines, number series]	[]	[key or screen]	[value]	[yes / no: the tax adviser, compliance officer or DPO confirms]

Settings and master data changed by the broker are kept: a release adds what is missing and never overwrites a value the broker has changed, unless this section says so.

10. Scheduled jobs

Job (code)	Change	Delivered	Action for the broker
[for example eis-outbox]	[new job / new timing / new parameter]	[On / Off, timing Asia/Manila]	[switch on in Master > Schedules when ... / none]

A new job is registered without changing the jobs the broker already edited. The Schedules and Batch Jobs document lists every job; update its support runbook for each new job.

11. Integrations and connectors

Connector or interface	Change	Mode delivered	Partner action
[for example SMS_SEMAPHORE, CTPL_AUTH, INSURER_API, BANK_FILES, BIR EIS, screening provider]	[new connector / new message type / new adapter option]	[Test mode / Live / Switched off]	[none / partner to certify / credentials to issue]

A connector delivered in test mode sends nothing outside the system. The partner's certification and the credentials stay with the partner and the broker.

12. Environment variables and keys

Variable	Change	Required	Who sets it
[for example PII_ENCRYPTION_KEY]	[new / renamed / new rule]	[yes: the API refuses to start without it / optional]	[DevOps of the hosting party, in the secret store; never in the release notes]

Never write a key value in the release notes. A new key is backed up with the database and added to the sealed escrow copy.

13. Database changes

Migration	What it does	Effect on existing data	Reversible by redeploying the previous release
[NNNN_name.sql]	[adds table / column / setting]	[none / records updated: ...]	[yes / no, explain]

Migrations are applied automatically when the API starts, under a lock. A database snapshot is taken before deployment.

14. Actions for the broker

14.1 Before deployment

- [for example: confirm the new setting value with the Accounting Manager]
- [UAT scripts to re-run in the test environment: ...]

14.2 After deployment

- [for example: switch on the job ... in Master > Schedules; check the E-mail Outbox and the Integrations outbox]
- [for example: import the brand pack exported from UAT; check a sample document]
- Check the smoke test result sent by iorta TechNXT.

15. Known issues in this release

Item	Effect	Workaround	Planned fix
[]	[]	[]	[release or backlog]

16. Testing performed

Test	Result
Automated business-rule tests	[n passed of n]
Regression set in the test environment	[n passed, n failed, n not run]
Broker UAT of the changed areas	[signed by ... on ...]
Security checks (dependency audit, image scan)	[result]

17. Rollback plan

Front end: redeploy the previous build. Back end: redeploy the previous image tag; migrations only add to the schema, so the previous release runs on the newer schema. The database snapshot is restored only if data must be rolled back, with the broker's approval. [Add any release-specific step.]

18. Approval

Role	Name	Decision	Date
iorta TechNXT release manager	[]	[Ready for deployment]	[]
Broker IT head or System Administrator	[]	[Approved / Approved with conditions / Not approved]	[]
CAB	[]	[Approved]	[]

19. Document Sign-Off

Serial Number	Description	Owner	Status
1	Replace every [placeholder] and delete the sections that do not apply before issue	iorta TechNXT release manager	Open

Sign Off Date	Signature	Approved By	Department & Project Role
